# DALI

What to do if the manual operation button on my DG/S is x.64.1.1 does not work?

Depending on the device type, the DALI gateway has one or two buttons 🖑 to manually switch the DALI outputs. If these buttons are without any function the manual operation may be locked. This function can be set via the communication object No. 2 "Disable manual operation/Status".

How to do it:

1. Enable parameter for manual operation

2. Create group address and link with the communication object

Number ▲	Object Function	Name	Description	Group Address	Length	C	R	W	T	U	Data Type
2	Disable manual operation/Status	Allgemein	Enable/disable manual operation	1/1/1	1 bit	C	R	W	T	-	enable

3. Download the application
4. Send a "0" on the communication object

Then the manual operation is released again and can be put back into manual operation with the touch of the button for more than 2 and less than 5 seconds.
