

DALI

Can I change the color temperature using a 1-bit telegram with the DG/S x.64.5.1?

The 1-bit presets are intended for this function. They can be found under ballasts, groups or templates in the “Color temperature Tc” parameters.

The screenshot shows a configuration interface for 'Group 1'. On the left, a sidebar lists 'Group 1 status', 'Group 1 fault', 'Group 1 functions', and 'Group 1 Colour temperature Tc' (highlighted in yellow). The main area contains the following settings:

Enable 1-bit presets for Colour temp.	<input type="radio"/> No <input checked="" type="radio"/> Yes
Colour temperature preset 1	3000 K
Colour temperature preset 2	5000 K
Transition time	5 s

Important: The value 0 calls preset 1 and the value 1 calls preset 2.
