

# Commissioning and Configuration

## How do you enter settings for scenes within free@home?

A scene produces a state that can be defined by the user. This, for example, allows the user to create a "TV" scene that dims the living room light, switches off the lights in the corridor and dips the blinds. Scenes cannot be switched ON or OFF. The same pre-defined status is always restored when a scene is called up. The states of the participants in a scene can be defined when the scene is created. A created scene can also be linked with a sensor to enable it to be switched locally.

The setting for a scene takes place under the Link option.

Please check the video with a description on how to enter the setting for scenes in free@home:
