Heating, Ventilation and Air Conditioning

FCC/S 1.x.x.1: What´s the purpose of the parameter "Send inactive control values cyclically"?

In a 2-pipe system switching between heating and cooling is triggered by a central unit. In these systems there is only one control value input for heating and cooling. If you activate this parameter the last value (active or inactive control value) will always be obtained on the input object.

For more information (with example) please see product manual chapter 7.5.1.3.
