

Heating, Ventilation and Air Conditioning

HCC/S 2.x.x.1: What happens if the controller gets switched off via the object "Control On/Off"?

If the controller is switched off, the HCC goes into a kind of "protection function". This means that the valve is closed and the pump is switched off. The setpoint temperatures set in the background guarantee a safe operation.

Note:

Heating is set to -31°C and cooling on +121°C.

The controller can be switched off via communication object 73 (channel A) and object 164 (channel B).

Unique solution ID: #1652
