

Outputs

How can light scenes be recalled and saved with an Analogue Actuator?

The recall of a light scene takes place using the object "8-bit scene".
Using this object, current output values can also be saved as scenes as standard.
Tip: With the ABB i-bus Tool, scene values can be saved simply and conveniently.
For this purpose, a control value is approached using the Tool and the "Save scene" button is then pressed. The scene is then saved in the device.
