

System, Infrastructure and Interfacing

How secure@home Central Unit and free@home System Access Point are connected?

To integrate the two systems, the secure@home Central Unit needs to be connected to the free@home System Access Point via free@home BUS. The Central Unit, in fact, will be managed from free@home as a native device. No additional devices (e.g. gateway) is needed.

In order to assure the security of the data exchange between the two systems, in the first steps of the commissioning the secure@home Central Unit automatically sends to the free@home System Access Point an encryption key. Once paired, the two systems are ready to work as an unique system.

Unique solution ID: #1540
